1. breadcrumbs. it's a small application, but it's always nice to know where you are.

2. a compact way to link to the editing or deletion of a record. visibility should be based on login creds. maybe use REST to accomplish this based on unique id of customer code. maybe instead of actually deleting a record, set a delete field to -1 in case of a mistake.

3. Seems like having kit description added to this view would be helpful. not called for in the concept drawing.

4. This page is view only. The underlying table is built by selecting which kits are available for each equipment type from the kit section of each record on the equipmentMgmt.html page.

see note 5 on index.html

1. breadcrumbs. it's a small application, but it's always nice to know where you are.

2. a compact way to link to the editing or deletion of a record. visibility should be based on login creds. maybe use REST to accomplish this based on unique id of customer code. maybe instead of actually deleting a record, set a delete field to -1 in case of a mistake.

3. see section 2 and 3 on kitMgmt.html to see how editing and deletion work inline.

4. the kit section of this record is shown as opened. press the bar to collapse kit section of the record. Maybe use a js variable to keep track of which record is expanded. only want one expanded at any time?

5. press the bar below the record to expand the kit section of the record. pressing this will close any other records that are expanded. only want one kit detail section expanded at any one time.

6. which kits are available for this equipment type are selectable and deselectable here. this is the oi section that will tie an equipment type to a kit in the database. table equipment\_kits\_available in the concept drawing. maybe the kit description should be added. not called for in the current drawing.

7. see section 4 on kitMgmt.html to see how adding a new record work inline.

8. Kits can be associated with equipment from the view, edit, delete section after a record for the new piece of equipment is created.

Manual

1. breadcrumbs. it's a small application, but it's always nice to know where you are.

2. a compact way to link to the editing or deletion of a record. visibility should be based on login creds. maybe use REST to accomplish this based on unique id of customer code. maybe instead of actually deleting a record, set a delete field to -1 in case of a mistake.

3. Seems like adding this field to the view would be helpful. not called for in the concept drawing.

4. This page shows what kits are installed on each machine.

5. see section 4 on kitMgmt.html to see how adding a new record work inline.

6. Look up possible values from tbl\_customer\_equipment for data integrity.

7. Look up possible values from tbl\_equipment\_kits\_available for data integrity.

8. will use dropdowns to drill down through tables to make a new record. this is a quick way to add a record when the possible values are limited to underlying tables. will use sub queries to keep the possible selections valid.

9. only view and delete are available in this section. edit would cause data integrity problems. if an incorrect kit was added, the user can simply delete the record and add another.

1. breadcrumbs. it's a small application, but it's always nice to know where you are.

2. a compact way to link to the editing or deletion of a record. visibility should be based on login creds. maybe use REST to accomplish this based on unique id of customer code. maybe instead of actually deleting a record, set a delete field to -1 in case of a mistake.

3. I feel like person of contact should be included in the customer record. or, even add a few pocs based on area of interest. employees of clients change unexpectedly. maybe this field can be linked to an external db field from the sales team. they'd be the group that keeps current on contacts.

4. see section 2 and 3 on kitMgmt.html to see how editing and deletion work inline.

5. see section 4 on kitMgmt.html to see how adding a new record work inline.

6. Maybe need a new field for the event's job number.

7. if the types of events are limited, maybe a new table can be made to allow for dropdowns. the result will be a record more uniform in appearance. if they vary somewhat, maybe add a note field to tbl\_customer\_events.
